

BRD4-1 (GST)

(Bromodomain containing protein 4, bromodomain 1)

CATALOG NO.: RD-11-157

LOT NO.:

DESCRIPTION: Human recombinant BRD4, bromodomain-1 (residues 44-170; Genbank Accession # NM_058243; MW = 42.1 kDa) expressed as an N-terminal GST-fusion protein in *E. coli*. BRD4, like other human members of the BET family of chromatin-binding proteins (BRD2, BRD3, BRDT), comprises two bromodomains (see reviews^{1,2}), protein modules that bind ϵ -N-acetyllysine residues^{3,4}. The ubiquitously expressed BRD4 functions as a transcriptional regulator² with roles in cell cycle progression^{5,6} and has recently been shown to be an atypical kinase that can phosphorylate RNA Pol II⁷. Recent structural studies have shown that BRD4-1⁸, like the bromodomain-1 of fellow BET family protein BRDT⁹, can bind simultaneously to two acetyllysine residues with appropriate spacing and sequence context, for example a histone H4 peptide acetylated at lysines 5 and 8 (H4K5AcK8Ac)⁸. Chromosomal translocations that produce BRD4-NUT fusion proteins are implicated in causation of a rare and aggressive cancer, NUT midline carcinoma¹⁰. Selective inhibitors of BRD4/BET family bromodomains¹¹⁻¹³ are showing promise as possible therapeutic agents for cancer^{11,14-16} and inflammation¹².

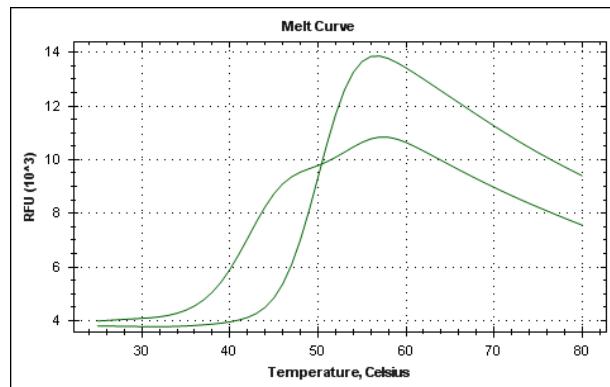

PURITY: >90% by SDS-PAGE

SUPPLIED AS: _ μ g/ μ L in 20 mM Tris/HCl, pH 7.5, 150 mM NaCl, 1.0 mM TCEP, 10% glycerol (v/v) as determined by OD₂₈₀
STORAGE: -70°C. Thaw quickly and store on ice before use. The remaining, unused, undiluted protein should be snap frozen, for example in a dry/ice ethanol bath or liquid nitrogen. Minimize freeze/thaws if possible, but very low volume aliquots (<5 μ L) or storage of diluted enzyme is not recommended.

Coomassie blue stained SDS-PAGE (4-12% acrylamide) of 6 μ g of RBC BRD4-1 (GST). MW markers (left lane) are, from top, 220, 160, 120, 100, 90, 80, 70, 60, **50**, 40, 30, 25, **20**, 15, 10 kDa.

Differential Scanning Fluorimetry of RBC BRD4-1 (GST) in Presence or Absence of (+)-JQ1. Thermal denaturation of BRD4-1 (GST) is detected (CFX384™ Touch thermal cycler, 'FRET' channel; Bio-Rad) by increased binding and fluorescence of the dye SYPRO® Orange (Life Technologies). Addition of the BET bromodomain inhibitor/ligand (+)-JQ1 (10 μ M) stabilizes the protein folding and shifts the T_m (inflection point) from 43°C to 49°C.

This product is not intended for therapeutic or diagnostic use in animals or in humans.
